

Olympic Success Around the World

Khushi Chaturvedi

DSA 202 (603)

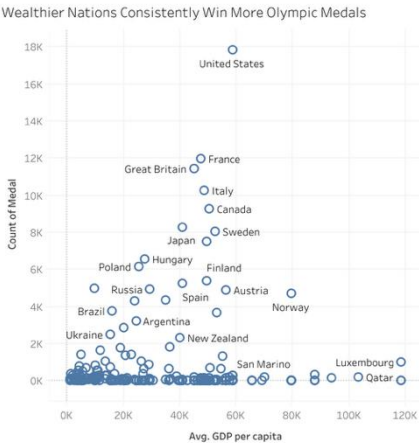

This poster explores how Olympic medal success differs across countries. Using Olympic medal and GDP per capita data, it highlights how medal outcomes reflect a combination of economic resources, geography, and the structure of the Summer and Winter Games.

1. Medal Count by Country

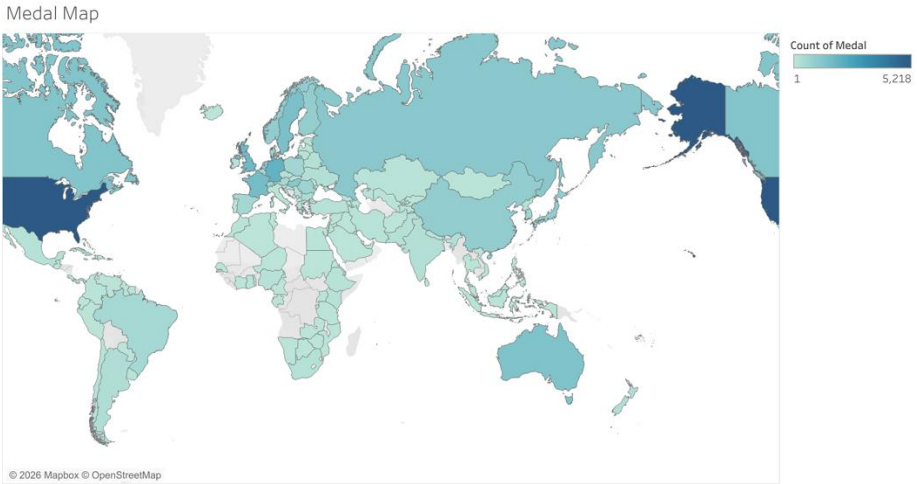

Medal totals are concentrated among a relatively small number of countries, with the United States standing out most strongly in this comparison.

2. GDP per Capita vs Medal Count

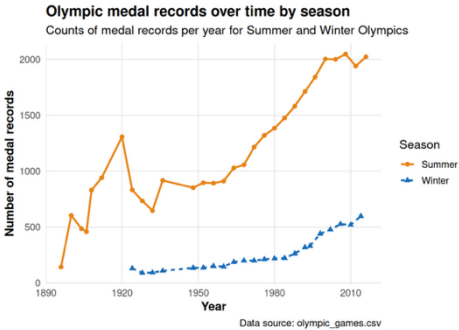

Countries with higher GDP per capita often have higher medal totals, suggesting that resources may support Olympic development over time.

3. Medal Map

Higher medal totals are clustered in North America, Europe, Russia, East Asia, and Oceania rather than being evenly distributed worldwide.

4. Olympic Medal Records Over Time by Season

Summer Olympic medal records are consistently higher than Winter totals because the Summer Games include more events and broader participation.

Sources: Kaggle Olympic Games dataset (olympic_games.csv) and Kaggle GDP per capita dataset (gdp-per-capita-worldbank.csv). Visualizations were created in Tableau, and the year-and-season chart was created in R using ggplot2 and dplyr.
